

STATE OF SURVIVORSHIP SURVEY: 2022

SCREENING & DIAGNOSIS

Individuals in the three experience categories have significantly different satisfaction levels, beginning with screening and diagnosis.

Percentages of People Misdiagnosed

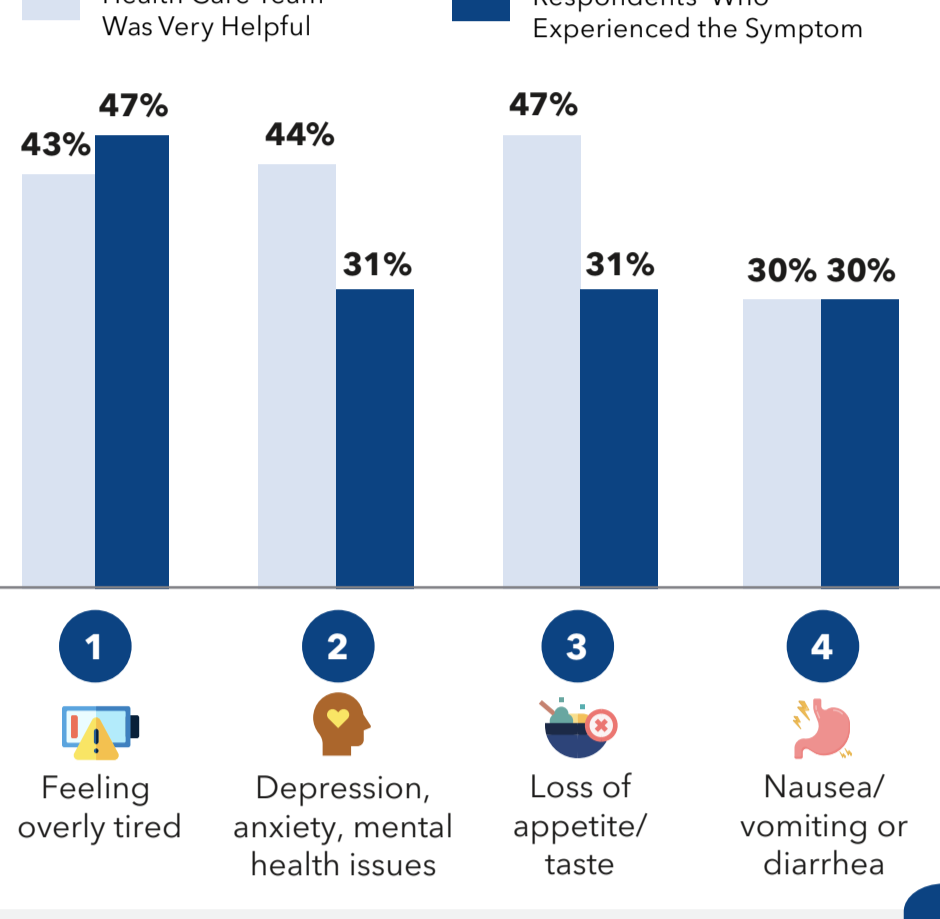

TREATMENT & CARE

Nearly three-quarters of respondents reported they were very satisfied with their treatment and care, due to a high degree of trust in and the relationship with their health care team. However, large disparities exist for those in the Negative Experience segment, including many underserved audiences.

Side Effects Experienced and Helpfulness of Health Care Teams

Respondents Who Always Felt Their Health Care Provider Listened to and Respected Them

Respondents Who Felt They Could Always Talk to Their Health Care Provider about Concerns

POST-TREATMENT CARE

Survivors tend to have low expectations during the post-treatment stage. When asked about their post-treatment care, approximately six in 10 respondents say they are satisfied – which is 10 points lower than satisfaction with in-treatment care – and less than half of respondents say their health care provider did a good job transitioning them to this stage.

Topics That Survivors Discuss with Their Health Care Provider Post-Treatment

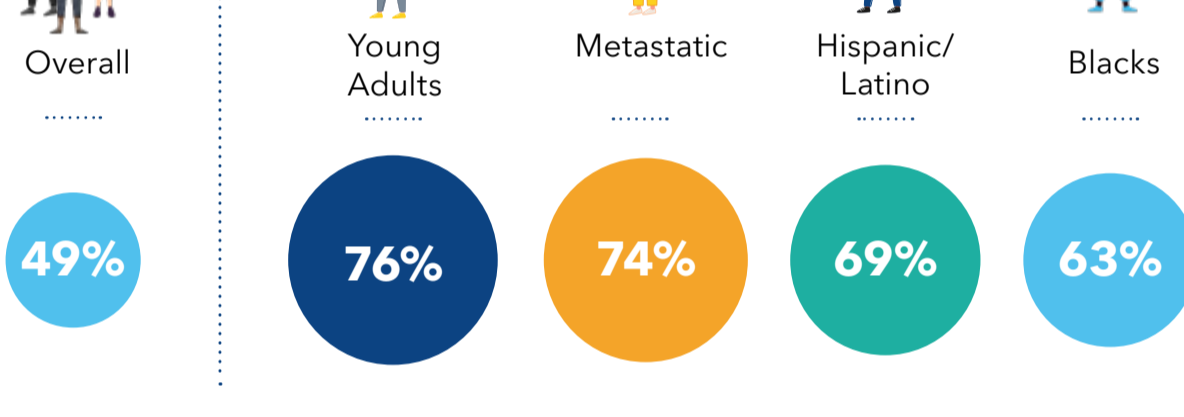

As one Hispanic respondent shared, "I will love to go to group therapy or something with other women that have been through this, because if I talk to my family, I have to be strong... I feel like I have to pretend like it's going to be okay. Like I'm just getting a tooth pulled out."

COSTS OF CANCER

Experienced Financial Sacrifices

In past surveys, the social, physical, emotional, and financial issues have emerged as top concerns. Concerns that increased most significantly since last year's survey include the cost of non-medical expenses like food, housing, and transportation (+14 percentage points), the cost of prescriptions (+11), the cost of caregiving (+11), the cost of medical care (+9), and understanding insurance (+9).

TREATMENT SYMPTOMS: DURING, AFTER, & STILL TODAY

6-in-10 still experience symptoms today. Mental health issues and sexual issues are most likely to be prolonged.

Symptoms Experienced (top 15 out of 23 shown)

	During Treatment 86% experience symptoms	After Treatment Completed* 74% experience symptoms	Still today* 60% experience symptoms
Feeling overly tired	47%	28%	14%
